

## MUTT TUTORIAL

There is some niche set of email usage as reporting tool. One solution could be establishing trivial terminal email client with MUTT ( „<https://www.elektroda.pl/rtvforum/topic2801638.html>” ).

1) install mutt:

```
#sudo aptitude install mutt
#vim ~/.muttrc
    set imap_user="admin@interia.pl"
    set imap_pass="admin1"
    set smtp_url="smtp://admin@interia.pl:587/"
    set smtp_pass="admin 1"
    set from="admin@interia.pl"
    set realname="admin@interia.pl"
    set folder="imaps://poczta.interia.pl:993"
    set spoolfile="+INBOX"
    set header_cache=~/.mutt/cache/headers"
    set message_cachedir=~/.mutt/cache/bodies"
    set certificate_file=~/.mutt/certificates"
    set move=no
    set imap_keepalive=900
    set sort=reverse-threads
    set sort_aux=last-date-received
    set editor='vim'
#mkdir -p ~/.mutt/cache/bodies ~/.mutt/cache/headers
#touch ~/.mutt/certificates
#chmod 600 ~/.muttrc
```

2) send email via terminal:

```
#echo „Message.” | mutt -s „Subject.” -a „/pathToAttachedFile.txt” -- admin@interia.pl
```
